## **DETAILED ACTION**

### ***Response to Arguments***

Applicant's arguments, see Notice of Appeal, filed 03/10/2009, with respect to claims 1, 2, 4-5, 9, 15, 17, and 19-20 have been fully considered and are persuasive. The 35 U.S.C. 103(a) rejection of claims 1, 2, 4-5, 9, 15, 17, and 19-20 has been withdrawn.

### **EXAMINER'S AMENDMENT**

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it **MUST** be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Thomas George, Reg. No. 45,740 on May 11, 2009.

The application has been amended as follows:

Claim 1. (Currently Amended) A method for identifying and configuring a system, comprising:

reading values of identification codes from each of a first plurality of devices of a first system;

generating a first system identifier value that identifies the first system as a function of the read values;

Art Unit: 2181

wherein the first plurality of devices is arranged and coupled in a scan chain, and the function used in generating the first system identifier value is further a function of respective positions of the first plurality of devices in [[a]] the scan chain;

storing the first system identifier value in association with respective configuration data sets for the first plurality of devices;

reading values of identification codes from each of a second plurality of devices coupled in a scan chain in a target system;

generating a target system identifier value that identifies the target system as a function of the values read from the second plurality of devices and respective positions of the second plurality of devices in the scan chain in the target system;

comparing the stored first system identifier value to the target system identifier value;

configuring the second plurality of devices in the target system with the respective configuration data sets in response to the stored first system identifier value matching the target system identifier value; and

halting configuring of the second plurality of devices in the target system in response to the stored first system identifier value not matching the target system identifier value.

Claim 2. (Currently Amended) The method of claim 1, wherein the step of reading values from the first plurality of devices comprises:

reading the value of a first register in each of the first plurality of devices, wherein ~~[[the]]~~ a state of each first register is a non-programmable value.

Claim 19. (Currently Amended) An apparatus for identifying and configuring a system, comprising:

means for reading values of identification codes from each of a first plurality of devices of a first system;

means for generating a first system identifier value as a function of the values of the identifications codes from the first plurality of devices;

wherein the first plurality of devices is arranged and coupled in a scan chain, and the function used in generating the first system identifier value is further a function of respective positions of the first plurality of devices in ~~[[a]]~~ the scan chain;

means for storing the first system identifier value in association with respective configuration data sets for the first plurality of devices;

means for reading values of identification codes from each of a second plurality of devices coupled in a scan chain in a target system;

means for generating a target system identifier value that identifies the target system as a function of the values read from the second plurality of devices and respective positions of the second plurality of devices in the scan chain in the target system;

means for comparing the stored first system identifier value to the target system identifier value;

means for configuring the second plurality of devices in the target system with the respective configuration data sets in response to the stored first system identifier value matching the target system identifier value; and

means for halting configuring of the second plurality of devices in the target system in response to the stored first system identifier value not matching the target system identifier value.

Claim 20. (Currently Amended) An [[arrangement]] apparatus for identifying and configuring a system, comprising:

a software tool hosted on a data processing arrangement; and

a system interface coupled to the tool and to a first system;

wherein the tool is configured to read values of identification codes from each of a first plurality of devices of the system via the system interface and generate a first system identifier value as a function of the values of the identifications codes from the first plurality of devices;

wherein the first plurality of devices is arranged and coupled in a scan chain, and the function used in generating the first system identifier value is further a function of respective positions of the first plurality of devices in [[a]] the scan chain;

wherein the tool is further configured to store the first system identifier value in association with respective configuration data sets for the first plurality of devices;

Art Unit: 2181

means for reading values of identification codes from each of a second plurality of devices coupled in a scan chain in a target system;

means for generating a target system identifier value that identifies the target system as a function of the values read from the second plurality of devices and respective positions of the second plurality of devices in the scan chain in the target system;

means for comparing the stored first system identifier value to the target system identifier value;

means for configuring the second plurality of devices in the target system with the respective configuration data sets in response to the stored first system identifier value matching the target system identifier value; and

means for halting configuring of the second plurality of devices in the target system in response to the stored first system identifier value not matching the target system identifier value.

The following is an examiner's statement of reasons for allowance: the prior art of record taken alone and/or in combination fails to teach the limitations of wherein the first plurality of devices is arranged and coupled in a scan chain, and the function used in generating the first system identifier value is further a function of respective positions of the first plurality of devices in the scan chain;

storing the first system identifier value in association with respective configuration data sets for the first plurality of devices;

Art Unit: 2181

reading values of identification codes from each of a second plurality of devices coupled in a scan chain in a target system;

generating a target system identifier value that identifies the target system as a function of the values read from the second plurality of devices and respective positions of the second plurality of devices in the scan chain in the target system, in combination with other limitations present in independent claims 1, 19 and 20.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
